UTAH SYSTEM OF HIGHER EDUCATION

UTILITIES INFRASTRUCTURE STUDY

Document Prepared By: Utah System of Higher Education David L. Buhler, Commissioner 60 South 400 West Salt Lake City, UT 84101-1284

Foreword

The State of Utah has made a substantial investment in the campuses that comprise the Utah System of Higher Education (USHE) and the capital facilities on those campuses serve to embody those investments. Well-maintained and programmatically current physical facilities are critical for attracting talented students, faculty, and staff to the USHE campuses, and for providing a quality learning and research environment once they arrive on campus sites. Attractive and technologically up-to-date buildings are a necessary condition for the USHE institutions to lead out in helping the State achieve its educational and economic goals. Another critical component of facilities investment, often unnoticed historically, is the utilities infrastructure which consists of production assets and distribution networks that service the buildings on each campus site.

Approximately one year ago, the USHE System brought together a group of individuals from across the State, tasked with more fully researching and documenting the condition of the utilities infrastructure piece of USHE capital facilities. Those individuals involved spent a great deal of time and effort in preparing this report that could well inform future decisions in the State of Utah on the utilities infrastructure front for years to come.

This report brings together in one place for the first time, important historical documentation regarding the production and distribution assets that comprise the utilities infrastructure systems present at the USHE campuses and the projected future funding needs of such systems. Significantly, the report takes the additional step of surveying national funding models for infrastructure, to see what the State of Utah might glean from other States. And perhaps most importantly, for those with limited time, it provides an Executive Summary which succinctly outlines the Key Issues surrounding USHE utilities infrastructure systems, and provides Recommendations for assuring that the existing infrastructure can successfully support higher education's facilities needs going forward. For the reader that can afford a deeper dive into the materials, the narrative of the report is further embellished with various appendices that cover the materials presented in substantially more detail.

A special thanks is due to W. Ralph Hardy, the Assistant Commissioner for Facilities Planning for the USHE System, as he not only served as the facilitator of the many group meetings for this project, but also as the primary author of the materials that comprise this report. Members of the Project Steering Committee and the Inventory and Assessment Task Force also contributed significantly to the narrative and appendices that are attached. We thank you for your interest in the results of this project.

Dr. Gregory L. Stauffer Associate Commissioner for Planning, Finance, & Facilities

ACKNOWLEDGEMENTS

This report is the result of the efforts of numerous dedicated people in the Utah System of Higher Education and Utah State Government as well as the contributions of private consultants. A special thanks to the following individuals:

Project Steering Committee

Michael G. Perez, University of Utah Associate VP for Facilities Management Charles Darnell, Utah State University Associate VP for Facilities Kevin P. Hansen, Weber State University Associate VP for Facilities and Campus Planning Robert Askerlund, Salt Lake Community College, Assistant VP of Facilities Services Dr. Gregory L. Stauffer, OCHE, Assoc. Commissioner for Planning, Finance, and Facilities W. Ralph Hardy, OCHE, Assistant Commissioner for Facilities Planning

Inventory and Assessment Task Force

Cory D. Higgins, University of Utah, Director of Plant Operations Mark Holt, Utah State University, Electrical Engineer Sheila Burghardt, USU Eastern, Facility Director Jacob Cain, Weber State University, Energy and Sustainability Manager David Tanner, Southern Utah University, VP for Facilities Management Robert Oliver, Snow College, Director of Facilities and Auxiliaries Sherry Ruesch, Dixie State University, Executive Director for Campus Services James Michaelis, Associate VP for Facilities Planning Robert Askerlund, Salt Lake Community College, Assistant VP of Facilities Services

State Government

Richard Amon, Department of Administrative Services, Executive Deputy Director John Harrington, DFCM, Energy Manager

Construction Control Corporation

Kenneth W. Ament, President Kris A. Larson, Senior Cost Estimator

Chevron Energy Solutions

Robert Hooper, Business Development Manager Frank Gallardo, Intermountain Region Project Manager

Executive Summary of Utilities Infrastructure Report

In order to provide a system of higher education that meets the needs of our state, Utah's public colleges and universities must have campuses and facilities that are up to date, reliable, and safe. Campus facilities are among the state's most valuable assets and represent significant taxpayer investment and expense. The challenges of keeping campus buildings, utilities infrastructure, landscape, hardscape and roads are many, and are exacerbated by age.

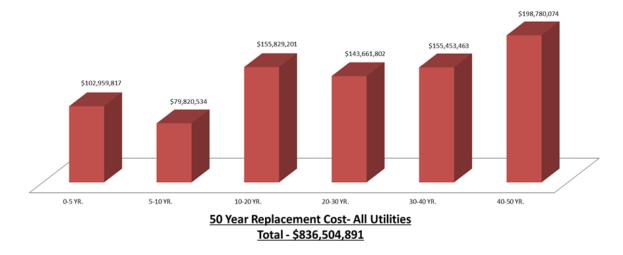

This report outlines the issues faced by the Utah System of Higher Education's institutionally owned utilities systems, including the lack of a dedicated funding mechanism to update utilities infrastructure needs in a timely manner. This report also puts the funding and oversight issues in the context of the broader need to adequately fund routine repair and preventive maintenance and deferred maintenance.

The findings of this report are consistent with those of numerous national studies, which have found that *"underfunding of maintenance and repair is a widespread and persistent problem"* across higher education facilities and infrastructure for many decades. (See Appendix B for the relevant references)

Key Issues Highlighted in the Report

- The recommended minimum budget allocation for capital renewal of buildings is 2.0% of the Current Replacement Value (CRV) of the facilities (1.5% for capital renewal and 0.5% for remodeling). While Utah was once a leader in addressing this important need by establishing Capital Improvement Funding in 1994, the statutory target of 1.1% is below the 2.0% recommended by professional industry studies. Furthermore, funding at the 1.1% level has only occurred three times since the statute's inception. Also significantly, while the CRV base used to calculate the amount of improvement funds available does not include the full replacement cost for utility distribution systems and generating plants, 28% of the Capital Improvement funds allocated over the past 15 years have been needed for utilities infrastructure projects. Some funds have also been needed for renewal and replacement of other non-building infrastructure including landscape, hardscape (surface parking, plazas, and sidewalks), safety and security (e.g., exterior campus lighting) and roads.
- Five USHE institutions have their own high-voltage substations, and a sixth is in the process of being installed. All institutions own and operate electrical distribution systems. The advantages of these institutionally-owned electrical power production and distribution systems include:
 - 1. Power Rate-Based Cost Reduction
 - 2. Reliability of Power
 - 3. Quality of Power
 - 4. Service Responsiveness

- 5. Accessibility for Maintenance
- There are two ongoing funding mechanisms (1. & 2. below) and several periodic mechanisms (3. through 5. below) used to fund maintenance, repair and replacement of facilities on USHE campuses.
 - 1. Annual Operation & Maintenance (O&M) Budgets: address routine maintenance and repairs
 - 2. Capital Improvement Funding: addresses capital renewal and replacement needs
 - 3. Energy Service Companies (ESCo) and Other Energy Savings Related Funding
 - 4. Capital Development Funding
 - 5. Other Institutional Funds
- As the Legislature considers potential funding mechanisms, it is important to bear in mind the condition, capacity and sustainability of the assets being maintained.
- A key desired outcome of this report is to focus attention on the need for dedicated, permanent revenue streams for the rehabilitation and replacement of USHE utilities production and distribution infrastructure. An evaluation of those needs that was commissioned as a part of this study shows an estimated need of \$836.2 million (in current dollars) of replacement costs for these assets over the next 50 years which are shown graphically below:

Recommendations:

 Institutional Ownership of Utilities Infrastructure – Institutional ownership and operation of these assets was found to be viable and in the financial and operational best interests of the state and should be continued.

- 2. Routine Maintenance and Repair The adequacy of existing annual O&M budgets is marginal and should be carefully evaluated for funding increases to avert further deterioration of physical plant assets. Additionally, it is recommended that the State Legislature return to the pre-recession practice of providing state-appropriated O&M support for authorized non-state funded projects based on the "use" of the facilities rather than the "source" of capital funding.
- **3. Capital Renewal Funding for Buildings and Non-utilities Infrastructure –** It is recommended that the statutory minimum of 1.1% of CRV be funded for these needs and that serious consideration be given to increasing the statutory minimum to the recommended minimum level of 2.0%, phased in over time as resources permit, in order to prevent continuing increases to the backlog of deferred maintenance needs.
- 4. Utilities Production and Distribution Infrastructure
 - a. Condition needs Serious consideration should be given to establishment of a separate funding mechanism for these needs, with consideration given to the establishment of perpetual "break-even" utilities as quasi-auxiliary enterprises for the ongoing operation and maintenance and provision of capital renewal of these assets.
 - b. Capacity The utility infrastructure costs resulting from addition of all new buildings, whether capital funding comes from state-funded or non-state funded sources, should be considered to be a component of new building construction budgets, not part of the funding mechanism for renewal and replacement of existing infrastructure. This would be accomplished by requiring that applicable costs are part of the capital budgets of all new capital development projects.
- 5. Deferred Maintenance Consideration should be given to the provision of one-time funding, from sources that might include general obligation bonding, one-time appropriations, or other one-time sources to address the growing backlog of these needs.

INTRODUCTION

USHE institutions have the mission of providing higher education excellence in instruction, research, community outreach, and life-long learning opportunities which are focused on economic development and long-term benefit to the State of Utah. To accomplish this mission our public educational institutions must have campuses and facilities that are modern, adequate, reliable, and safe. Campus facilities are among the state's most valuable assets and, as such, represent a significant taxpayer investment and expense. And the challenges of keeping campus buildings, utilities production and distribution infrastructure, landscape, hardscape (surface parking, plazas, and sidewalks), and roads in acceptable condition are exacerbated by age.

One of the major challenges facing USHE institutionally owned utility systems is the lack of a dedicated capital funding mechanism to replace long-lived and expensive utilities infrastructure in a timely manner. In addition, this utilities production and distribution infrastructure is composed of unseen capital assets that, nevertheless, directly support the mission and objectives of higher education institutions and requires periodic major investment. This reality is evidenced by the problems encountered by Snow College 16 years ago (failure of direct-buried steam and condensate lines), by Utah State University 10 years ago (new heat plant and utilities distribution system), and faced currently by the University of Utah (electrical distribution and high temperature water distribution systems failures). A desire to understand and avoid the possibility of similar problems being encountered at other institutions in the future is what drives this study. It is also the intent of this study to specifically address the funding and oversight issues and put them in the context of the broader need of funding for routine repair and preventative maintenance needs as well as major maintenance, repair and replacement including deferred maintenance.

DEFINITIONS

Please refer to APPENDIX A for definitions of terms that will be used throughout this report. Because of the complexity of the issues, a familiarity with the terms will help to avoid confusion and to enhance understanding of the issues involved.

BACKGROUND

Buildings and utilities production and distribution systems inevitably deteriorate, become obsolete, and need replacement. Underfunding of routine repair and preventative maintenance and capital renewal and replacement leads to a backlog of deferred maintenance which results in code deficient and unsafe buildings as well as unreliable infrastructure. The resulting outcome is unattractive and poorly functioning buildings; unsightly grounds; and failing utility production and distribution systems that jeopardize the programmatic usability of space necessary for academic (instruction and academically based research), student, administrative, and community service activities. Additionally, energy and natural resources are wasted as these systems become less efficient over time.

A major study published in 2009 by APPA: The Association of Higher Education Facilities Officers states:

"The burdensome problems of major maintenance and capital renewal/replacement have troubled higher education since the 1970s. The term deferred maintenance emerged in the early 1970s as college and university administrators began to realize the serious nature of plant problems on their campuses. The deteriorated plant conditions produced by ignoring older facilities during higher education's post-World War II expansion were compounded by the following:

- Poor designs for institutional durability
- Cost cutting that rapidly produced space with inferior construction techniques, and innovative materials that showed early failures
- Soaring utility costs
- Inflation-reduced operations and maintenance budgets
- Inadequate funding for capital renewal and major maintenance
- Increased government regulations resulting in reallocation of resources and further deferral of maintenance
- The 1980s saw initiatives by legislators, governing boards, campus presidents, business officers, and facilities directors aimed at corrective action. Despite those efforts, a subsequent APPA study, the results of which were published in the 2012 March/April issue of Facilities Manager, found that "The deferred maintenance problem for public higher education facilities clearly worsened from 1997 to 2008...with some variability observed among governing and coordinating board states."

There have been numerous other major studies done over the years in an effort to focus attention on these ongoing and, for the most part, increasing problems. Descriptions of several of the most noteworthy ones are included as *APPENDIX B*. The reader of this report is encouraged to take the time to read this additional material in order to more fully appreciate the substance and magnitude of the problem. These studies all deal, to varying degrees, with the funding levels needed to assure that the long-term capital renewal and adaption needs of the institutions are met. In summary, they conclude that the following levels of funding are needed:

- Plant Renewal (excluding consideration for non-building infrastructure needs) 1.5% to 2.0% of plant replacement costs (CRV) is needed to keep the plant in good condition for its present use based on facility life cycles.
- Plant Adaptation (building code and standards compliance as well as changing programmatic requirements) – 0.5% to 1.5% of plant replacement costs (CRV) is needed to alter institutional facilities to comply with changing regulations, to meet new
- expectations, and to serve changing programmatic needs.
- Sufficient catchup maintenance to address deferred maintenance backlog needs and bring the plant into reliable operating condition.

Thus, the ongoing need for plant renewal (buildings only) and plant adaptation is a minimum of 2.0% of CRV. And this does not include the funding required for non-building infrastructure needs and reduction of the accumulated backlog of deferred maintenance. The reality is, therefore, that despite significant efforts by the Utah State Legislature to address these issues, the only ongoing funding source available to meet all of these needs is the existing statutory funding level of 1.1%, which is significantly below the minimum need for plant building renewal and adaption alone and has been fully funded only 3 times since its inception. As a result, over time, the preventative maintenance and plant renewal funding, both for buildings and major utility infrastructure systems has been inadequate as institutions make the difficult choices of using the funds for the most pressing and critical needs of both, the result being inadequate attention to both, thereby resulting in increasing deferred maintenance backlogs.

Please note that a large amount of data has been collected, evaluated' and analyzed in this study. In order to allow the readers to focus on the substantive issues of the study, much of the detailed information has been placed in the "Appendices" of the report. Readers are encouraged to refer to these "Appendices" for a more thorough understanding of the issues.

HIGH VOLTAGE ELECTRICAL SUBSTATION AND DISTRIBUTION SYSTEM OWNERSHIP

During discussions about the major utilities production and infrastructure funding issues over the past year or so, the question has been raised as to the advisability of USHE being in the business of production and distribution of utilities as well as maintenance, repair, and replacement of the infrastructure: viz., might entities, whose sole business is to provide those systems and services be able to do so more efficiently and more cost effectively? This question has been taken seriously and has been carefully studied by the task force of this study and professional consultants. The question has primarily been raised in the context of electrical services since it is generally understood that provision of heating and cooling systems services are routinely part of the institutions' domain. It should be noted that the issues being addressed pertaining to electrical power only apply to institutions and campuses that have a concentration of buildings in one place, which include main campus locations for all institutions and full-fledged branch campuses for some. There are many delivery sites where electrical service is directly connected to the buildings without the use of substations and distribution grids (USU Innovation Campus in Logan, USU Blanding Campus, USU Uintah Basin Campus, WSU Davis Campus, Snow College West Campus (Ephraim) and Richfield Campus, DSC Hurricane Campus, UVU Wasatch Campus, SLCC Jordan and Miller Campuses, etc.). It is not economically feasible for the institutions to use substations and grids for distribution of electrical power to these facilities.

It also is true that the issues pertaining to maintenance of substations and electrical-power distribution grids are system maintenance issues.

Also noteworthy is that these arrangements are not unique to Utah's higher education institutions. For reasons that will be addressed, the direct involvement of higher education institutions in distribution of electrical power to their campus buildings is a common practice, and some (e.g., University of Missouri at Columbia) have cogeneration plants with the capability to provide for all of the heating and electrical needs of a campus. Higher education institutions have operated their own utility production and distribution systems for many years, which may include: electrical; heating and cooling; culinary water; irrigation; and compressed air systems. As a result they have core competencies in these areas with trained and licensed professional employees. Most institutions maintain storm and sanitary sewer assets as well. With a long and varied history of providing reliable utility services to their campuses, college and university operated utilities have core competencies in these areas consisting of trained and licensed professional employees.

A more detailed description of the advantages of institutional owned electrical power distribution systems is provided in *APPENDIX C* of the report.

The relevant advantages of owning and operating their own electrical distribution systems are compelling for institutions that have concentrations of buildings in one place. It is less compelling for campuses with loads of less than 4 Megawatts to own and operate high-voltage substations. As described in Appendix C of this report, for these campuses the benefit, typically, would be marginal. In 2010 Southern Utah University contracted with Chevron Energy Solutions to perform an Investment Grade Audit to explore installation of a high-voltage electrical substation and other energy conservation measures. While many of the energy conservation measures identified have been or are being implemented, the conclusion of the study was that installation of the substation would not result in sufficient savings beyond ten years to provide an adequate reserve for system replacement.

Institutional concerns about the highly specialized safety precautions and hiring of qualified personnel at a competitive wage to perform required maintenance also played into the decision. In addition, the limited land available and resulting impact on campus aesthetics, as well as the potential for straining community relations as a result of installation and routing of transmission lines through residential and high density commercial zones and a high-voltage substation in proximity to residential neighborhoods were contributing factors to the decision.

Careful examination of these issues shows that the nature of higher education needs is such that institutional ownership of the on-campus electrical distribution grid is essential for meeting the unique needs. And institutional ownership of high-voltage substations is highly desirable in large and complex research universities as well as other institutions of sufficient size and complexity. The conclusion drawn from this analysis is that it is in the best interest of and the best value for the State for larger institutions to own, operate, maintain, and replace as needed the high voltage production facilities and medium voltage distribution systems that provide electrical service to their campuses.

It is also noted that Rocky Mountain Power and other electrical companies continue to be great partners in meeting the needs of USHE institutions with a high level of reliability.

HISTORY OF FUNDING FOR MAINTENANCE, CAPITAL RENEWAL OF BUILDINGS, AND RENOVATION AND REPLACEMENT OF UTILITIES INFRASTRUCTRUE

In Utah there are currently two ongoing funding mechanisms and several periodic funding mechanisms that have been used to address the issues of maintenance, repair, and replacement of plant facilities on campuses of the Utah System of Higher Education:

1. Annual Operation and Maintenance (O&M) Budgets – These are the funds normally used to address normal and routine "Maintenance and Minor Repairs" and are provided through the annual operating budget cycle. The issues addressed are normally cyclical, planned activities performed to maintain the originally anticipated life of a fixed asset, or an established suitable level of performance, and are much like oil and filter changes, checking fluid levels, replacing belts, and maintaining proper air pressure in the tires of an automobile. Normal and routine maintenance excludes activities that expand the capacity or life of an asset or otherwise upgrade the asset to serve needs greater than or different from those being served at the time the work begins (things analogous to replacing the alternator or transmission of an automobile).

Current operation and maintenance budgets in USHE institutions are austere for a variety of reasons:

- a. While personal services (salaries and benefits) and periodic increases for utilities rate increases have been funded by the legislature over time, the "non-personal services" items in the O&M budgets (which represents about 35 cents of each O&M dollar spent, and include expenses such as operational and office supplies, non-capital equipment, printing and photocopying, purchased services, vehicle fuel, travel, etc.) have not received funding increases from the Legislature for more than two decades. While an estimated dollar amount of this lost purchasing power has not been calculated, it unquestionably has resulted in some level of decreased care of USHE facilities.
- b. The timing and amounts of intermittent increases for utilities budgets have not always covered actual cost increases and have left some institutions with unfunded deficits.
- c. Over the years, and likewise common to institutions throughout the country, budget cuts have been imposed that not only have further reduced the non-personal services O&M budgets, but also have significantly reduced funding available for personnel and contractor services, lessening the ability to perform appropriate corrective and preventative maintenance. These budget cuts are rarely, if ever, restored
- d. The recent economic downturn resulted in the Legislature not being able to fund O&M increases for facilities that were previously authorized to seek state O&M support and/or were otherwise qualified to receive consideration for such support under State Board of Regents policy. A total of 23 facilities representing \$4.3 million of unfunded O&M support fall into this category. If state revenues had been sufficient, consistent with historical practice, state-funded O&M support most likely would have been provided for these facilities. Consideration should be given to a reexamination of the practice of state-appropriated O&M funding for buildings whose capital funding comes entirely from non-state sources. Many such facilities serve identical purposes in support of the institutions' assigned roles and missions as do buildings whose capital funding comes in full or in part from state sources. Though there are other possible models, one that has been suggested would be to base decisions about whether or not to provide state-funded O&M for a project on the *use of the facility rather than on* the *source of capital funding*.

A white paper detailing the evolution of Board of Regents policies on the issue of qualification for state-funded O&M support is attached as *APPENDIX E* and provides insight into this issue.

An analysis that was concluded last year shows the status of USHE state-funded O&M budgets for the period of 1987-88 through 2011-12. A copy of this analysis is attached as *APPENDIX F*. Starting with the base year of 1987-88, the analysis shows the amounts specifically funded by the Legislature in the ensuing years to the budgeted amounts, including utilities increases, increases for new space added, and proportional amounts funded for compensation increases. The impact of budget cuts imposed is also reflected. *The analysis shows that system wide, the institutions have increased the O&M operating budgets by \$22.7 million more than the calculated base budget provided by the legislature.* The increases in O&M amounts budgeted above the funded levels were achieved through reallocations from other budgets and periodic use of part of the student tuition increases over time.

These depleted levels of O&M funding make provision of the normal and routine maintenance for all facilities an even bigger challenge and result in increased levels of deferred maintenance which exacerbates the future major repair and replacement problems and related costs.

2. Capital Improvement (CI) Funding – In its 1994 session the Utah State Legislature created an ongoing funding mechanism to address the capital renewal and replacement needs by specifying in statute [UCA 63A-5-104(5)] that "the Legislature may not fund the design or construction of any new capital development projects, except to complete the funding of projects for which partial funding has been previously provided, until the following funding requirement for capital improvement has been met: for 1995, .5% of the replacement cost of existing state buildings; for fiscal year 1996, .75% of the replacement cost of existing state buildings; and for fiscal year 1997 and thereafter, .9% of the replacement cost of existing state facilities to capital improvements." In 2001 the statute was amended to increase the statutory requirement from .9% to 1.1% with the additional provision that "if the Legislature determines that an Education Fund budget deficit exists, the Legislature may, in eliminating the deficit, reduce the amount appropriated to capital improvements to 0.9% of the replacement cost of state buildings."

For fiscal years 2001 through 2005 funding was provided at the .9 percent level to help accommodate budget balancing measures. For FY 2006 through 2008 the full statutory amount provided slightly exceeded the statutory amount of 1.1 percent (FY 2006 actually received about 1.14 percent). During the ensuing recessionary years state revenues have not been sufficient to fully fund the statutory requirements, and the statute has been amended on a year-by-year basis to enable provision of amounts less

than the statutory requirement (.9% for FY 2009, .7% for FY02010, .6% for 2011 and 2012, and .8% for 2013).

The foresight of the State of Utah to implement this funding mechanism – Utah was a leader in the adoption of this method of funding - has been instrumental in providing an ongoing revenue stream to defray the costs of the most serious problems. A significant issue, however, is the previously mentioned fact that these annual allocations have also been needed to fund major utility production and distribution infrastructure needs at the institutions. As was noted in the "Background" section of this report, the low end of the range of funding recommended for the on-going "Capital Renewal" of buildings alone is 1.5 percent of current replacement value and excludes major utilities infrastructure and accumulated deferred maintenance backlogs. So the annual capital improvement funding provided by the legislature, even if fully funded at the statutory requirement of 1.1 percent, still would be significantly less than the recommended minimum amount of 1.5 percent, even if none of the amount provided was used for major utilities infrastructure. Since a considerable amount is used on an ongoing basis for the utilities infrastructure, the amount available for the capital renewal of buildings is diminished to be even further below the recommended range minimum, leading to increases of the deferred maintenance backlog.

This fact is clearly seen from the results of a 15 year history that was compiled of the uses of Capital Improvement funding allocations (see *APPENDIX G* for a summary of this information). *These data show that over the 15 year period analyzed, \$116.3 million, representing 28% of the total Capital Improvement allocations to USHE institutions, was spent for utility infrastructure projects.* While these CI funding allocations are, for the most part, based on building needs, more than one fourth of the funds have been needed to address the utility production and distribution infrastructure needs of the institutions.

The key point is that even though only a very small portion of the value of the utility production and distribution infrastructure is included in the CI funding formula, higher education institutions, most of which have campuses with major utility infrastructures, are disadvantaged vis-a-vis most other state institutions because they are required to use significant portions of their annual CI allocations for that purpose.

Particularly noteworthy is the fact that a very large portion of the CI allocations made to Snow College from 1998 to 2004 were needed for construction of utility tunnels that were required by the failure of direct-buried steam and condensate lines. A total of \$3,245,500 (\$900,000 in FY 1998, \$200,000 in FY 2000, \$1,148,000 in FY 2002, \$832,000 in FY 2003, and \$265,000 in FY 2004) was used for this purpose. Had an alternative funding mechanism for the utility infrastructure needs been in place during that time, a reduction in the backlog of deferred maintenance needs for buildings and other non-utility infrastructure could have been accomplished.

- 3. Capital Development Funding Over the past 15 years there have been a number of times when Capital Development funding was provided by the legislature for projects that included replacement and/or provision of new major utility infrastructure needs. Over that period \$86.1 million has been used for that purpose. A summary of these projects by institution is included in *APPENDIX H*.
- 4. ESCo and Other Energy Savings Related Funding During the past fifteen years a significant number of utilities infrastructure projects have been funded through Energy Service Companies (ESCo) which are commercial businesses that provide a broad range of comprehensive energy solutions including designs and implementation of energy conservation projects that are financed through the energy savings achieved. In addition, a number of utilities infrastructure projects have been undertaken by USHE institutions "in house" that have also been financed with the energy savings realized. Over the 15 year period evaluated, a total of \$76.3 million was spent from this source for utility infrastructure projects (see APPENDIX H for a summary of this information by institution).
- Projects Funded Using Other Institutional Funds Over this same time period there has been a total amount of \$37.8 million of other institutional funds spent on numerous utility infrastructure projects. (*APPENDIX H* also includes a summary of this information by institution.)

CURRENT AND FUTURE FUNDING MECHANISMS

<u>Condition, Capacity, and Sustainability</u> - The context for the assessment of the adequacy of current funding mechanisms and for consideration of potential funding mechanisms for the issues addressed in this study is:

Condition – The "condition" category pertains to the functionality of the assets and includes "Routine Repair and Preventative Maintenance" as well as the "Capital Renewal and Replacement" of facilities and is the broad category that is the primary focus of this study. Decisions regarding when it is time to replace a building, a major piece of equipment, or a utility infrastructure distribution network involve distinguishing between *physical life* and *economic life.* An asset is often physically able to continue operating after its economic life, but typically does so at a cost or rate that renders it economically obsolete. The economic life almost always is less than absolute physical life for reasons of technological obsolescence, physical deterioration, or product life cycle. The shortage of funding to replace assets that still have physical life but are past their economic life results in expenditure of ongoing time and money on inefficient and obsolete assets until they ultimately fail. Inadequacy of funding on a timely basis almost always results in greater long-term costs when assets are used to the end of their physical life, instead of the end of their economic life. This typically results in higher ongoing maintenance costs, lost efficiency, greater replacement costs, costs of unscheduled downtime, and unscheduled loss of use of the facilities. Funding to address the "condition" is broken down into two categories:

- Routine Maintenance and Repair Ongoing funding for these needs is provided from allocations made in the annual operating budget cycle. The funding mechanism for the annual operating budget consists of the deliberations and recommendations made by the Higher Education Joint-appropriations Subcommittee of the Legislature. Inadequacy in these budgets inevitably leads to less efficient operation of facilities and related equipment, shortened life cycles, and increased capital renewal needs. In this context, the adequacy of these budgets needs to be carefully evaluated and funding increases provided as appropriate.
- Capital Renewal and Replacement This category has been divided into three components:
 - 1. Buildings
 - a. Capital Renewal The funding ranges described in the "Background" section above apply to these facilities. Thus, the 1.5 percent of replacement value recommended is the minimum amount deemed to be needed to provide for the capital renewal needs to avoid further increases in deferred maintenance projects and the inherent problems of increasing deterioration, life safety, code compliance, provisions for accessibility, and ultimately lost use of the facility. This minimum typically would apply to campuses with newer and/or less complex facilities. And since the problems of maintenance and capital replacement needs are magnified by the age of campus facilities and infrastructure, campuses with older and more complex facilities would typically need to be funded above the minimum to ensure long-term viability.
 - b. Adaptation A minimum of .5 percent of replacement value is recommended for funding of these expenditures that are required to

adapt the physical plant to the evolving needs of the institution and to changing codes, standards, and regulations that are generally externally imposed.

The funding mechanism currently in place for these needs is viable. However, because the funding generated is significantly below the industry-recommended minimum, it is important that the Legislature make every effort possible to sustain the current statutory level of 1.1 percent of replacement value and look for ways to increase it to at least the guideline minimum level of 2.0 percent.

2. Major Utilities Production and Distribution Infrastructure – A description of these assets is provided in the *APPENDIX I* of this report. A viable funding mechanism should be established to assure that these critical assets are properly maintained and renovated or replaced on a timely basis. In order to address this issue, an important component of this study has been to compile a comprehensive inventory of these assets at each of the campuses of the USHE institutions where this is applicable. This inventory was compiled by facilities professionals at each of the USHE institutions and includes the relevant information about the types of assets, sizes, and installation dates. (Please note that the inventory compiled does not include what can be defined in the Information Technology (IT) arena as a type of utility infrastructure. A brief discussion of this issue is found in *APPENDIX J*.)

These detailed inventories have been evaluated as to expected life and priced by Construction Control Corporation, an independent construction management and cost consulting firm. The following graph shows the estimated costs of replacement that will have to be addressed by the State over the next 50 years projected by ten year time periods and provides a broad look at the amounts and timing of funding that will be required to repair and/or replace these utility infrastructure assets:

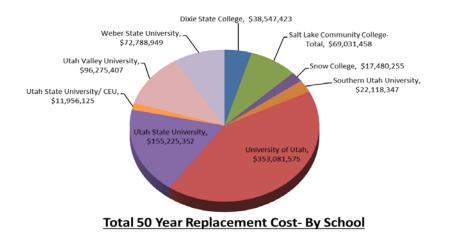

The projected total replacement cost is \$836.2 million with amounts shown by time period over the 50 year time frame. These projections are based on "economic life" which, simply put, is the time after which money is saved by replacing the asset. Please note that this amount is not the total value of the inventory for two reasons:

- 1. The replacement costs of assets whose life cycle is less than 50 years require replacement more that once during the 50 year time frame may be included more than once in the total cost amount.
- The value (\$56.4 million) of existing assets whose first scheduled replacement exceeds the 50 year time frame are not included in the \$836.2 million.

Please also note that this analysis deals only with existing assets and their replacement and is based on *current pricing factors with no inclusion of future inflation*. Assets resulting from future capacity expansion will also add to this total as time goes by.

The following "pie-chart" shows the distribution of the total by institution:

The full Construction Control Corporation report, that includes a detailed list of these needs by institution, is included as *APPENDIX K*.

Up until now a clearly defined process for funding these utility infrastructure needs on an ongoing basis has not been utilized. Funding, when the needs have arisen, has come from the following sources:

- Capital Improvement Funding Allocations
- Capital Development Funding
- ESCo and Other Energy Saving Project Funding
- Other USHE Institutional Funding
- Other Non-building infrastructure This category includes landscape, hardscape (surface parking, plazas, and sidewalks), safety and security (e.g., exterior campus lighting), and roads

Capacity – This category pertains to the need for increases in capacity of major utility infrastructure as a result of growth related projects. The utility infrastructure costs pertaining to growth should be considered to be a component of new building construction budgets, not part of the funding mechanism for renewal and replacement of existing infrastructure. To accomplish this, it is recommended that each new construction project pay a "utility infrastructure fee" based on the demands it will place on the utility infrastructure system. Capacity is not free, and these charges should be included as part of the capital budgeting process. The fees should be set to reflect the value of utility connection costs (boilers, chillers, electric, water, drainage, etc.) that a project would have to fund were it a stand-alone facility.

The "utility infrastructure fee" would, thereby, trigger the necessary funds for utility systems to keep pace with growth.

It is noted that, in general, such costs are currently being charged by the institutions for nonstate funded capital projects. And as was noted in the "Capital Development" portion of the History of Funding for Maintenance, Repair, and Replacement of Plant Facilities section of this report, some state-funded capital development projects have included funds to cover the costs of additional utility infrastructure components at the institutions. They are not, however, always included in state-funded capital development project budgets.

Sustainability – The notion of sustainability is embodied in the concept of "stewardship," which in the framework of facilities is, simply, the continued care and management of capital resources for the benefit of future generations. A 2010 APPA publication titled Strategic Capital Development: The New Model for Campus Investment states: *"Facilities stewardship…means a high-level and pervasive commitment to responsibility for optimizing capital assets, to achieve a high-functioning and attractive campus. It includes a major commitment to capital asset preservation and quality. Stewardship is about the long view of an institutions' past and future. It forms the backdrop for hundreds of discrete facilities investment and management decisions. Ultimately, facilities stewardship is one of the most compelling responsibilities of institutional leadership. And facilities stewardship expresses core values of the institutional culture."*

There are four categories of facilities needs as defined in the previously mentioned 1989 SCUP publication titled *Financial Planning Guidelines for Facility Renewal and Adaption*. The four categories identified are:

- **<u>1.</u>** Ongoing Maintenance Routine upkeep such as lubrication of moving parts, checking electrical systems, patching roofs, and so forth. Provision for these expenditures must be adequate: neglect of routine maintenance accelerates the deterioration of the plant. Normally on-going maintenance is funded by an institution's operating budget.
- <u>2.</u> <u>Facilities Renewal</u> A systematic approach to repairing or replacing major building subsystems such as roofs, HVAC, electrical, and plumbing systems, which have predictable life-cycles, to maintain and extend the life of the facility. This category is sometimes referred to as Planned Maintenance or Capital Repair. It is normally funded by an institution's capital budget.
- **<u>3.</u>** <u>Deferred Maintenance</u> The accumulation of a backlog of pending physical plant improvements to correct the influence of age, use and normal wear and tear. Continued underfunding of on-going maintenance and facilities renewal increases the total backlog of deferred maintenance.
- <u>Adaption</u> Alterations in physical plant to address changes in use, codes, or standards. Such changes include those required under the American Disabilities Act and those made to keep up with technology as well as facilities that become functionally and/or programmatically obsolete.

While these categories of facilities stewardship are closely related in higher education institutions, they are often financed through different funding mechanisms. Because decisions about timing and scope of projects in each of the categories may have significant budget implications for the others, they should be looked at holistically. For example, inadequate funding for ongoing maintenance will result in higher levels of deferred maintenance and, ultimately, in an earlier and greater need for capital renewal and replacement.

The term "sustainability," as it applies to this report, also pertains to the use of "best practices" in materials and methods in the ongoing maintenance and repair as well as capital renewal of and reinvestment in utility infrastructure components. Ultimate success in this area is dependent on several factors:

- Availability of adequate funding for proper on-going maintenance and repair of the assets
- The existence and use of appropriate preventative maintenance and monitoring programs to optimize the investment in these assets
- Availability of adequate funding for timely capital renewal of the assets when they reach the end of their economic life
- Use of "best practices" materials and procedures in the installation of these assets.

High levels of sustainability have been challenging to achieve because of inadequate resources. As a result, institutions often have found it necessary to pursue a "band-aid" approach by using inadequate funding primarily to address only their most critical needs. In addition, accurate records of the exact locations of utilities distribution infrastructure components have not been available always, particularly at those institutions with large numbers of old buildings and utilities infrastructure components. Ongoing efforts by the institutions over the years have led to much more accurate and reliable inventory records of these important assets, and the completeness and accuracy of these records have been further enhanced by the inventory conducted as a part of this study.

DEFERRED MAINTENANCE

The backlog of deferred maintenance, sometimes referred to as "catch-up maintenance," is the ultimate indicator of the adequacy of ongoing funding for normal (or routine) maintenance, plant renewal, and adaption funding. If the level of deferred maintenance is trending upward, it is an indication that existing funding levels are inadequate. If it is trending downward, it is reason to be encouraged that the existing funding levels are making physical plant condition more serviceable.

A 2012 "Issue Brief" published by the Office of the Legislative Fiscal Analyst titled *Capital Improvement Funding and Allocation* provides reason for significant concern. The Issue Brief cites a DFCM Facility Condition Assessment report that identified approximately \$450 million in statewide "immediate" repair needs and an additional \$1,550 million (or \$1.55 billion) of needs in the next five to ten years, a total of \$2.0 billion.

	FY 2009		FY 2010		FY 2011		FY 2012		FY 2013 Est.	
Immediate Need	Ś	249,596,000	\$	284,482,000	\$	259,600,000	\$	439,434,000	\$	448,960,00
5-year Need		759,350,000	Ŷ	1,089,384,000	Ŷ	1,061,000,000	Ŷ	1,116,148,000	Ţ	1,148,300,00
10-year Need		359,865		427,643,000		316,000,000		332,857,000		402,870,00
Total	\$	1,368,841,000	\$	1,801,509,000	\$	1,636,600,000	\$	1,888,439,000	\$	2,000,130,00
Building Repairs	\$	1,058,479,000	\$	1,463,666,000	\$	1,383,100,000	\$	1,751,522,000	\$	1,823,240,00
Infrastructure		310,362,000		337,843,000		253,500,000		136,917,000		176,890,00
Total	\$	1,368,841,000	\$	1,801,509,000	\$	1,636,600,000	\$	1,888,439,000	\$	2,000,130,00

As was noted in the "issue Brief," existing funding levels clearly will not be able to meet those needs.

CAPITAL RENEWAL FUNDING MECHANISMS FOR UTILITY PRODUCTION AND DISTRIBUTION INFRASTRUCTURE

One of the desired outcomes of this study is to focus attention on the need for establishment of dedicated, permanent revenue streams to fund the renovation and rehabilitation of USHE physical plant assets, with a primary focus on utility production and distribution infrastructure. There is no commonly used method of ongoing funding for funding these critically needed assets. And as been noted throughout this report, existing funding mechanisms are only marginally successful. The percentage of CRV is the most widely used methodology, with utility infrastructure lumped together with buildings and other infrastructure in ways similar to what is done in Utah even though the CRV used in making the calculations does not include the value of the non-building infrastructure components of the asset inventory. And most (almost all) states are facing the same issues that are serious problems in Utah. An effort has been made to learn some of the specific things that are being done in other places.

Practices in Other States – Several other institutions were contacted in other states to determine their practices in dealing with the costs of capital renewal funding, particularly as it pertains to utility infrastructure needs. There is no consistent pattern, but there are some interesting options for consideration as follow:

 Facilities Maintenance Reserve ("Sinking") Funds – There is a variety of funding mechanisms that fall in this general category of funding, of which summaries of several are provided below:

<u>Missouri</u> – State statute requires the transfer of one percent of "net general collections" to the "Facilities Maintenance Reserve Fund" and specifies that the general assembly may also appropriate other money to the fund. The fund is invested by the state treasurer with interest earnings credited to the fund. The general assembly then appropriates moneys from the fund for maintenance, repair or renovation of state facilities. This is similar to the Utah Capital Improvement Funding practice with the primary difference being the existence of an interest earning reserve fund from which allocations are made each year. As much as 1.5 percent of replacement value has been allocated in a given year (2001) with the current rate being 1 percent. Only one institution in the University of Missouri System has the value of its utility infrastructure included in the CRV inventory base on which allocations are based.

<u>Colorado</u> – Colorado has a Controlled Maintenance Trust Fund that is funded by an annual transfer of "fifty percent of the general fund revenues for the prior fiscal year in excess of general fund appropriations, statutory rebates, and statutory transfers, not to exceed fifty million dollars." The actual formula is rather complicated and the amount actually transferred is determined by a recommendation made by a capital development committee to the general assembly for funding. The state goal is to fund 1 percent of current replacement value each year, but that level has rarely been reached, and the balance of the fund has been cleared out from time to time in order to balance the state budget as allowed by statute.

- Dedicated Revenue In 1993 Pennsylvania dedicated a stream of income from a 2 percent realty transfer tax to be used for higher education deferred maintenance and other state needs. Funding has ebbed and flowed over the years depending on other state needs. It was eliminated in the FY 2010 budget and its future is now considered to be uncertain.
- "Break-even" Utility This is, essentially, a perpetual financial model. There are a number of institutions that operate their utilities production and distribution services as break-even "quasi-auxiliary enterprises" that include funding of R&R accounts for provision of maintenance and capital replacement needs. Included in this group are the universities of Arkansas, Michigan, Missouri-Columbia, New Mexico, New Mexico State, Texas A&M, Virginia, et al.

This model requires a financial separation of the utilities operations from the general facilities budgets of the institutions. Utilities dollars are maintained separate from the general physical plant operating funds which results in clear financial and managerial accountability. The result is a perpetual utilities infrastructure renewal plan. Entities using campus provided utilities are billed a "surcharge" above the actual cost of the utilities. The surcharge revenue is deposited in an R&R account and is used to defease revenue bonds issued to fund capital renewal of utilities infrastructure as well as to fund less costly projects directly. *This option has a clear long-term advantage over most others in that it represents a "permanent" solution because it essentially ensures that maintenance and renewal of these critical assets is not jeopardized during periods of decreasing resources.*

Implementation of this option requires an infusion of funding to cover the state-funded portion of the surcharge – the surcharge pertaining to auxiliaries and other self-supporting entities (e.g. university hospitals) would be covered from those entities' budgets. The increases for state-appropriated budgets would typically be funded with increases to the annual operating budgets or student tuition and/or fee increases.

 Capital Improvement Bonding – State bonding authority has been used and/or is currently used by a number of states to provide funds specifically for the purpose of capital renewal. Such states include South Carolina, Florida, North Carolina, Texas, et al. And though not a higher education issue, in 2008, Santa Ana City, California voted two to one for a \$200 million bond issue to restore their unacceptable second rate school facilities.

CONCLUSIONS AND RECOMMENDATIONS

The following statement is made at the conclusion of the report of the aforementioned study titled *Capital Budgeting Practices in Public Higher Education* that was published in the APPA January/February 2012 issue of Facilities Manager:

It is clear that an overwhelming majority of states do not set aside operating funds for renewal and replacement of public higher education facilities, as suggested by facilities experts. It is undeniable that the current economic situation in the states, and the limited recovery to date, will only add additional billions to the growing backlog in public higher education infrastructure investment, to say nothing of the additional investment needed to meet the facilities needs of "Tidal Wave II."

The vast majority of the states do not deploy practices recommended by facilities management experts, including the allocation of a small percentage of operating funds

for deferred maintenance. Similarly, a majority of states do not set aside the **minimum** of 3 percent (bolding added) of their operating budgets for renewal and replacement of facilities in public higher education. States could make use of successful models in other states and at other public institutions. It should be noted that some states have been quite creative in addressing these needs through dedicated funds, special line items, or other programs.

While it is true that Utah has been one of the states that has made an effort to address these needs through the annual Capital Improvement allocation made by the State Legislature, the authorization and implementation of ESCo projects, and occasional provision of special line item capital development funding, it is clear from the increasing deferred maintenance backlogs and failures of critical infrastructure systems that the current levels of funding provided are inadequate.

Because the Utah Capital Improvement funding formula for colleges and universities is based primarily on building values, it is not, for the most part, designed to address utility infrastructure renewal. Yet, with increasing persistence, higher priority utility infrastructure system renewal needs act as a drain on funding designated for capital improvement of buildings. Accordingly, this practice has lead to increases in campus building related deferred maintenance instead of an intended reduction of it. Likewise, the small relative scale of CI funding is insufficient to effect timely replacement of the longest lived and most costly utility infrastructure assets. Such is the case noted earlier in this report with regard to the infrastructure needs of the U of U, USU, and Snow College. The effectiveness of the current CI funding mechanism can only be considered marginally successful in that it has provided a much needed source of funds for some of the most critical building and utility infrastructure issues found on USHE campuses.

Facilities have always been the backbone of American higher education and without adequate facilities, teaching, research, and community service will almost certainly be impaired. These capital needs of public higher education need to be consistently and formally addressed if Utah is to effectively utilize its human resources to meet the educational and societal needs that are being encountered and will continue to be faced in the future. Legislative leadership, together with leaders and professional organizations within higher education, can work together to determine the best way to find and/or create permanent and recession-proof revenue streams to fund the ongoing renovation and rehabilitation needs of the physical infrastructure of Utah's higher education institutions.

Recommendations

- Institutional Ownership of Utility Infrastructure The conclusion drawn from this study is that it continues to be in the best interest of and the best value for the State for all institutions to own, operate, maintain, and replace as needed medium voltage distribution systems that provide electrical service to their campuses. It is likewise desirable for most of the institutions, especially those with large campuses and high levels of electrical power usage, to own, operate, and maintain the high voltage production facilities.
- Routine Maintenance and Repair The adequacy of existing annual O&M funding should be carefully analyzed and adjusted where deemed appropriate. In addition, it is recommended that the legislature consider a return to the pre-recession practice of providing state-appropriated O&M support for authorized non-state funded projects based on the "use" of facilities rather than on the "source" of capital funding.
- 3. Capital Renewal and Replacement Funding for Buildings and Non-utility Infrastructure Needs – USHE institutions support the Legislature's efforts to return to full funding of the statutory minimum of 1.1% of CRV for plant renewal and adaption of buildings and non-utility infrastructure needs. Further consideration should be given to increase the statutory minimum to 2% to enable adequate capital renewal and adaption, and to prevent further increases to the backlog of deferred maintenance needs.
- 4. Utility Production and Distribution Infrastructure This category is separated into two categories:
 - A. <u>Condition Needs</u> The analysis of the costing consultant shows the need for this funding over the next 50 years to be more than \$836 million dollars. Because of the critical nature of these assets in assuring the ongoing operation of USHE campuses, it is recommended that consideration be given to establish an ongoing separate funding mechanism for their renovation and replacement. Several options were summarized earlier in this report should the State Legislature choose to pursue this recommendation. The preferred option of the Steering Committee of this study, especially for the research universities and other larger and more complex institutions, is the establishment of "break-even" utilities as quasi-auxiliary enterprises to fund the ongoing operation and maintenance needs as well as R&R accounts for provision of capital replacement needs in order to assure a perpetual utilities infrastructure plan.

As was noted earlier in the report, implementation of this option would require an infusion of funding to cover the state-funded-budget portion of the surcharge which, typically, would be funded with increased state appropriation for the annual operating budgets or student tuition and/or fee increases.

- B. <u>Capacity</u> The Steering Committee also recommends that the utility infrastructure costs resulting from addition of new buildings should be a component of new building construction budgets, not part of the funding mechanism for renewal and replacement of existing infrastructure. To accomplish this, it is recommended that each new construction project pay a "utility infrastructure fee" based on the demands it will place on the utility infrastructure system. As noted earlier in the report, in general, such costs are currently being included by the institutions for non-state funded capital projects, but are not included routinely in the capital budgets of state-funded projects.
- 5. <u>Deferred Maintenance</u> As has been noted earlier in the report, the increasing deferred maintenance backlogs are primarily the result of inadequate funding for plant and utility infrastructure renewal needs. Funding to address this deferred maintenance backlog was not a primary focus of this study, but provision of periodic one-time funding from sources that might include general obligation bonding, one-time appropriations, or other one-time sources should be explored to deal with this growing problem.

APPENDIX A Definitions

- Major Utility Production and Distribution Infrastructure This category includes the physical plant assets that are used to produce, where applicable, and distribute the utilities needed to utilize the physical facilities of the institutions for their intended purposes. There are two subcategories:
 - Production Assets Heat production assets included are central high temperature hot water and steam plants and production devices and underground backup fuel system storage. Chilled water production assets include chillers and cooling towers of all types that service multiple buildings. Electrical production assets include high-voltage substations, transformers, photovoltaic panels, and cogeneration equipment. Water production assets, both potable and irrigation where they exist, primarily wells; water storage assets where they exist, including elevated, ground level and underground water storage tanks as well as reservoirs; and pump houses and related equipment.
 - Distribution Assets These assets include the networks of distribution systems for delivery of heat, cooling, electrical, water, and natural gas. These assets typically exist underground (in distribution tunnels or directly buried), at ground level, or overhead and include utility distribution feeders (wires and piping), duct banks and vaults, major switchgear, valves, pumps, controls, gauges, meters, etc.). Also included are sanitary waste and storm water disposal systems.
- **Other Campus Infrastructure** Primarily non-building and non-utility (production and distribution) items including parking and transportation infrastructure (vehicular and pedestrian), landscape, safety and security (e.g., campus lighting), etc.
- Routine Repair and Preventative Maintenance This category is defined as work or projects funded by normal maintenance resources received in the annual operating budget. These funds are critical in mitigating the deterioration process of the assets to optimize their economic life.
- **Capital Renewal and Replacement** This category includes major repair and replacement (R&R) project expenditures that are required to keep the physical plant in reliable operating condition for its present use. These expenditures are over and above normal maintenance and are necessary for the repair and replacement of assets that

have deteriorated beyond their economic and physical life and are typically funded by Capital Improvement fund allocations.

- Plant Adaption These are expenditures that are required to adapt the physical plant as required to the evolving needs of the institution (resulting from programmatic changes, changes in the nature of disciplines, new technology, etc.) and to changing codes, standards, and regulations that are generally externally imposed (e.g., Americans with Disabilities (ADA) accessibility guidelines, asbestos removal, new fume hoods to meet new air quality and safety requirements, etc.). These needs are also over and above normal maintenance and typically are <u>not</u> funded by maintenance resources received in the annual operating budget.
- **Current Replacement Value (CRV)** Current replacement value is defined as the total amount of expenditure in current dollars required to replace an institution's facilities to their optimal condition. It should include the full replacement cost for all buildings, grounds, utility systems, and generating plants.
- Annual Physical Plant Operation and Maintenance Budget These funds are provided through the annual operating budget process for systematic day-to-day maintenance in order to control the deterioration of the college or university plant facilities, e.g., structures, systems, equipment, pavement, grounds.
- **Capital Improvement Funding** For purposes of this study this term refers to the annual allocations of funds made by the State Legislature for capital renewal and replacement of physical plant assets.
- **Capital Development Funding** This category includes legislative funding for major physical plant projects including projects in excess of \$2.5 million, new buildings, and major remodeling and renovation projects.
- **Deferred Maintenance** This category consists of the backlog of maintenance projects for which work has been deferred on a planned or unplanned basis to a future period until funds are available. For the most part, these are capital renewal and replacement projects that have been deferred due to a lack of funding and that typically result in progressive deterioration of the facility for the current function.

- **Physical Life** Physical life is the potential service life of an asset before physically becoming unable to produce a good or service and is almost always is greater than the economic life.
- **Economic Life** Economic life is the period of time during which a fixed asset costeffectively produces a good or service. It is the time after which we save money by replacing the asset.

APPENDIX B Significant Plant Renewal Studies

<u>Financial Planning Guidelines for Facility Renewal and Adaption</u> – This 1989 study was a joint effort of the Society for College and University Planning (SCUP), the National Association of College and University Business Officers (NACUBO), the Association of Physical Plant Administrators of Universities and Colleges (APPA), and Coopers and Lybrand. The study referred to several then recent studies that dramatically demonstrated the serious deterioration of American college and university facilities, cited "serious underfunding as the primary cause of this condition, and recommended the following approach to correct the problem as summarized in the Executive Summary of the report:

In order to preserve the value of its physical plant to the changing mission of the institution, each college or university should allocate:

- Sufficient "plant renewal funds on an ongoing basis to keep the plant in good condition for its present use, based on facility life-cycles (1.5%-2.5% of plant replacement cost for most institutions);
- AND sufficient "plant adaption" funds on an ongoing basis to alter the physical plant for changes in use and codes and standards, based on recent experience and judgment (0.5%-1.5% of plant replacement cost at most institutions);
- AND sufficient "catchup maintenance" funds over a short-term period to bring the plant into reliable operating condition, based on a facilities audit.

Committing to the Total Cost of Ownership: Maintenance and Repair of Public Buildings – This 1990 study was conducted by the Building Research Board of the National Research Council. The conclusions and recommendations were based on the finding that "underfunding of maintenance and repair is a widespread and persistent problem." The study concluded that an appropriate total budget allocation for routine maintenance and capital renewal is in the range of 2 to 4 percent of the aggregate current replacement value (CRV) of the facilities (excluding major infrastructure). It should also be noted that this range deals only with the ongoing annual needs and does not include the "one-time" funding needs required to reduce deferred maintenance backlogs. The study noted that while this 2 to 4 percent range is most valid as a budget guide for a large inventory of buildings and over periods of several years, it is also deemed to be valid as a rule of thumb with small inventories when applied over a longer period, such as five to ten years.

Analyzing SUNY Facility Renewal and Backlog Needs – In 2007, the Rockefeller Institute of Government oversaw this study on facilities at the State University of New York (SUNY). The study was conducted by Pacific Partners Consulting Group, Inc. (PPCG) headquartered in Stanford, California. PPCG specializes in analytic and policy studies and has over twenty-five years of experience with public and private higher education facilities management. The study provided "benchmark" data from PPCG system clients consisting of the 36 SUNY campuses with nearly 55 million gross square feet of space and the following five higher education systems with 108 campuses and over 150 million gross square feet of space:

- California State University System (24 campuses)
- Minnesota State Colleges and Universities (53 campuses) Universities with Medical and/or Research Facilities
- University of Texas (15 campuses)
- Oregon University System (7 campuses)
- University of California (9 campuses)
- SUNY Institutions
 - o 36 State-operated campuses
 - o 2 Contract colleges (Cornel and Alfred Ceramics)

Those benchmark data pertaining to the average annual renewal funding as a percentage of CRV are as follows:

System	Low Average	<u>High</u>
California State University	1.2% 1.4%	1.5%
Minnesota State Colleges & Universities	1.1 % 1.4%	1.9%
SUNY	1.4% 1.6%	1.7%
University of Texas	1.5% 1.7%	1.8%
Oregon University System	1.6% 1.7%	1.8%
University of California	1.6% 1.7%	1.8%

The averages for these study institutions are above or very nearly at the recommended 1.5% minimum, while the Utah statutory target is .4% below the recommended minimum, and has been funded at the 1.1% statutory level only three times.

<u>Capital Budgeting Practices in Public Higher Education</u> – This study was conducted by APPA – Leadership in Educational facilities (formerly known as the Association of Physical Plant Administrators) and was published in the APPA January/February 2012 issue of Facilities Manager. In that study, 40 of the 50 states responded to requests for information about then current practices in funding for renewal and replacement of existing facilities. In response to the question "What percent of operating funds are set aside for renewal and replacement in your state?" 25 of the 40 states responded. Of these 25, 20 states set aside between 0 and 1.5% at the state level for facilities, and 17 of these 20 set aside less than 1%, below what the literature suggests as a minimum. Five states set aside 2.0% or more for renewal and replacement of facilities, and one state indicated that they set aside more than 5.1% for this purpose.

APPENDIX C Advantages of Institution Owned Electrical Power Distribution Systems

While ownership of electrical power distribution facilities by utility companies is a possible alternative, many institutions, including most large universities, have found that direct ownership and operation has several advantages. Institution owned and operated utility systems more effectively facilitate the campus mission by being capable of directing greater focus on the institution's unique set of priorities and constituencies:

 Power Rate-Based Cost Reductions – Institutions that meet appropriate economies of scale and subsequently choose to own and operate their own high voltage electrical infrastructure will realize electric rate-based cost reductions from the power supplier of about 30% relative to a lower voltage supply. However, the lower rates are a result of the institution providing O&M and capital renewal on the infrastructure as opposed to the electric power provider. The lower rates also enable the institutions to invest more heavily in reliability and redundancy on their systems than a utility company would typically provide. Those estimated rate-based cost reductions for USHE institutions having such facilities are as follows:

University of Utah	\$4.8 to \$5.5 million				
Utah State University	\$500,000				
Utah State University – CEU Campus \$110,000					
Weber State University	\$460,000				
Utah Valley University	\$500,000				

The projected annual rate-based cost reduction for Salt Lake Community College once their sub-station is operational is \$360,000.

This cost reduction, which is applicable to the institutional ownership of the high-voltage substation, is partially offset by the on-going routine annual maintenance costs, which are typically minimal, and the ultimate major repair and/or replacement of the sub-stations, which, depending on equipment, is typically is required every 20-25 years or so.

It should be noted, however, that while this cost avoidance can be a significant motivation for institutional ownership of high-voltage substations, the advantages are only apparent when the loads are sufficiently large. For loads less than 5 Megawatts the efficiency of the transformers and switchgear is compromised and the cost benefit from the reduced rate applicable to high voltage electrical power does not sufficiently address the maintenance, repair

and replacement costs of owning and maintaining the substation. As the loads increase, the cost effectiveness of the institution owned substation increases with the pricing structure becoming more advantageous with the resulting greater cost reductions.

 Reliability of Power – Institutional ownership of the high-voltage sub-station and delivery system assures a higher level of reliability in delivery of the electrical power. High voltage substation circuit delivery of power is less susceptible to shorts, distribution damage, and overloading. Higher Education high-voltage substations are interconnected with utility owned high-voltage substations to form a transmission system that is used to move power throughout the utility's service territory. This transmission system typically is equipped with protection schemes that include automatic three times re-closure mechanisms to clear faults to keep the system energized. There are fewer customers connected to such a transmission system.

Customers not having high-voltage substations, that include higher education institutions as well as commercial and residential customers, receive their power supplies from utility-owned transmission systems stepped down from highvoltage substations to distribution level voltage (12.47 Kv or 480 V) There are more outages at the distribution level than at the transmission level due to the higher number of customers and lines connected. High-voltage substations are designed to keep problems from transferring to the transmission system. Distribution lines, on the other hand, are protected by fuses or breakers. Most utility outages are caused by customer problems and vehicle accidents that bring down the utility distribution system by blowing the fuses or tripping the breakers that must be manually replaced/reset at the utility-owned substation. Highvoltage substation circuit delivery of power is less susceptible to shorts, distribution damage, and overloading.

Institutional ownership of the substation also facilitates provision of redundancy in the systems. With redundant systems, almost every building can be supplied power from two directions through a "loop-system" employed in the distribution system. This greatly reduces the chances that instructional, as well as critical research and health-care programs and services are not disrupted by power outages (resulting from repairs or campus changes) regardless of a single component failure anywhere in the system. While utility companies could provide equivalent redundancy, it would result in measurable rate increases.

- Quality of Power Not being on a utility company circuit populated with many other residential and commercial customers increases the quality of the power in two ways. Firstly, it eliminates "dirty" power, which is described as spikes, surges, sags, harmonics gaps, and electrostatic and electromagnetic interference. This "dirty" power is the cause of significant damage to machinery and technology installations and triggers many hours of expensive downtime. It is one of the electric industry's most common problems. Secondly, it provides a more consistent primary voltage delivery. It is not uncommon for low voltage substations to deliver power with voltage variations that are greater or less than 5% of nominal.
- Service Responsiveness As the owner of the electrical distribution system, an
 institution can generate an immediate response by in-house maintenance staff
 to troubleshoot and isolate the cause of many problems. Power also can often
 be restored by appropriate switching and "back feeding" power once a fault has
 been isolated. In those cases where the repairs are more complex, the in-house
 work force can do initial troubleshooting and assessment immediately and
 operate most of the switchgear. They, for the most part, can identify and find
 failed components quickly. In those cases where the required training or needed special
 tools or equipment are not available, the institution can expeditiously make
 contract with high voltage service companies to effect the repairs necessary.
- Accessibility for Maintenance Institutional ownership of distribution systems • enables them to define, manage, and schedule their own maintenance programs and costs to align with mission assignments (academic, research, community, and medical where applicable). In some cases, electrical distribution components are collocated in underground tunnel systems with natural gas lines, steam and hot water lines, chilled water lines, culinary water lines, etc. These complex and higher cost feeder systems have electrical duct banks that isolate the electrical lines and include spare conduits that facilitate campus expansion and rapid feeder replacement. This congestion of underground utility systems creates risks during repair and capacity expansion projects and clearly favors Institutional ownership of the electrical distribution lines by allowing the in-house maintenance crews that have first-hand knowledge of the systems to have unrestricted access, whereas if those lines were owned by an electrical utility company there would be significant issues on access, security, and responsibility for possible collateral damage.

In other cases, outsourcing the utility infrastructure to a third party would entail establishment of easements and rights of way for each piece of equipment, each substation, each manhole or vault, and each medium and low voltage circuit to provide the needed access. In addition, institutional need for access to work on other utilities within the easements would require third party authorization and or consultation.

- Lead-time for Required Changes The dynamics and unique requirements of higher education institutions – especially, though not limited to, major research universities – results in a greater complexity in implementation of current and future non-standard features in the distribution system and requires that changes be accommodated expeditiously. Direct ownership and operation of utilities systems better positions institutions to respond to their evolving utility needs, including new technology needs for instructional programs, repurposing a facility for a new academic mission, research opportunities that require a highly reliable electrical supply, etc.
- Third party ownership of the substations and delivery systems would significantly reduce the flexibility and cost benefits available from current and future centralized and combined heat and power facilities (e.g., natural-gas fired cogeneration) and other alternative and renewable energy sources.

The Executive Summary of a substantive report prepared in 2009 by Energy Strategies, Inc. for the University of Utah is attached as *APPENDIX D*. This study included an analysis of the cost impact of transferring the University's electric power distribution facilities to Rocky Mountain Power compared with the current mode of operation. The analysis concludes that over the estimated economic life (2010 through 2045) of the distribution facility replacements for which the University has requested funding the University will achieve net savings equivalent to \$174 million in today's dollars (estimated to be about \$450 million in then current dollars) by maintaining ownership and operation of the distribution facilities. The resulting recommendation is for the University to continue to own and operate its high-voltage substations and distribution facilities.

APPENDIX D Energy Strategies, Inc. University of Utah 2009Utility Infrastructure Study

WRITTEN TO: MIKE PEREZ, CORY HIGGINS	Date: December 16, 2009

WRITTEN BY: NICK TRAVIS, JUSTIN FARR	Rev: 2
REGARDING: HIGH VOLTAGE ELECTRICAL SERVICE STUDY	

Executive Summary

It is recommended that the University continue to own and operate its Distribution Facilities rather than transferring them to Rocky Mountain Power. Even though this requires a \$112 million near-term investment in electrical infrastructure, it will result in dependable and growing cost savings having an estimated present value of \$174 million (\$450 million in then current dollars through 2045). In addition, this approach better positions the University operationally to respond to its evolving utility needs.

The University of Utah ("University") experienced a peak demand for electricity of about 66 megawatts (MW) and used about 270,000 megawatt hours (MWh) of electrical energy in the fiscal year ending June 30, 2009. Virtually all electricity was supplied by the local electric utility, Rocky Mountain Power ("Utility"). The University paid the Utility about \$13 million. Because the University receives delivery of power from the Utility at transmission level voltage, it is eligible for service at the lowest cost tariff available to large customers. As a result, the University saved about \$6 million in the cost of purchased electricity. It is projected that University's electric demand will about double over the next 25 years; savings available from the lower cost tariff will grow proportionately.

<u>Utility delivery of power at transmission level voltage also enables the University to</u> <u>directly offset purchased electricity with less expensive power it produces on campus</u>. Otherwise, utility regulations would require that power produced by the University be sold to the utility at a price that is expected to be well below the cost of purchased electricity. The University has installed a highly efficient 6.5 MW cogeneration plant that will co-produce high temperature water and about 50,000 MWh of electricity annually.

In combination, the lower cost tariff and ability to offset purchases with self-generation offer the University an expected present value savings of about \$226 million through FYE 2045. During this period, associated annual savings grow steadily from about \$6 million to about \$25 million.

In return for the lower cost tariff and right to directly displace purchases with selfgeneration, the University assumes responsibility for the facilities needed to transform and distribute the transmission voltage power received from the Utility for the various consumers on campus. Collectively, these facilities are referred to as the Distribution Facilities.

The University has determined that a capital investment of about \$112 million (in then current dollars) must be made in non-discretionary replacements and upgrades of the Distribution Facilities over four fiscal years starting in FYE 2010 to maintain a safe and reliable electric supply. The annual savings from the lower cost tariff and offset of purchases with self-generation would more than cover the annual bond payments associated with the \$112 million investment. However, in light of this substantial capital requirement, the question has been posed as to whether the University would be better served if the Utility were to assume ownership and ongoing operational responsibility for the Distribution Facilities.

Discussions with the Utility confirmed that it is not precluded by regulation from accepting a transfer of ownership of the Distribution Facilities from the University. If such a transfer were to be attractive to the University, then it must afford the University financial incentives to forego the \$226 million in savings available from a lower cost tariff and the offset of purchases by self generation, and it must be operationally viable. Potential financial incentives are that the Utility: 1) pay a purchase price for existing Distribution Facilities, 2) invest in non-discretionary Distribution Facilities replacements and upgrades rather than the University, 3) provide capital in the future for distribution facilities needed to serve new loads, and 4) assume responsibility for operation and maintenance of Distribution Facilities. Let's consider these in reverse order.

Once the Utility owns the Distribution Facilities, it will assume responsibility for their operation and maintenance. The present value of savings to the University is expected

to be about \$30 million. This represents an initial annual savings of less than \$2 million growing to over \$3 million by 2045.

Once the University takes delivery at less than transmission voltage, <u>the Utility will be</u> <u>allowed to make contributions it is currently precluded from making toward distribution</u> <u>facilities needed to serve growth in load</u>. The amount of the contribution ("Extension Allowance") is capped as a function of the estimated incremental revenue to the Utility. <u>The present value of future Extension Allowances is estimated to be about \$22 million</u>.

Therefore, the present value of the purchase price paid for existing Distribution Facilities and of contribution toward the \$112 million in required upgrades and replacements must exceed \$174 million (\$226 million less \$30 million less \$22 million). It is believed <u>Rocky Mountain Power would resist paying a purchase price for the existing assets</u> as there is not a clear mechanism for cost recovery and that would undermine how the Utility does business with large commercial and residential projects. Therefore, even if the Utility paid for all near-term, non-discretionary improvements to the Distribution Facilities, the cost of electric service would increase materially. However, <u>it is unlikely that the Utility will provide any significant capital for the required improvements in Distribution Facilities</u>. Rocky Mountain Power would require that the University reimburse it or pay directly for improvements to bring the distribution system up to Rocky Mountain Power standards before conveying the facilities to the Utility. To the extent the University requires improvements above and beyond those required by Rocky Mountain Power, those also would be funded up front by the University.

Moreover, while Utility ownership of the Distribution Facilities is operationally viable, most large Universities have found that direct ownership and operation better positions the institution to respond to its evolving utility needs including those of research opportunities that require highly reliable electricity supply.

APPENDIX E History of Policy Decisions Pertaining to State Appropriated O&M Funding for Non-state Funded Capital Development Projects

The Higher Education Act of 1969 created the State Board of Regents and charged them with the responsibility for "conducting continuing studies and evaluations of the facilities, grounds, buildings, and equipment at the institutions under its jurisdiction;" establishing and maintaining "an up-to-date master plan;" "establishing criteria for and determination of the needs and requirements for...institutions;" and for "providing for the initiation and finance of such projects as are deemed necessary to meet and satisfy the projected patterns of growth and maintenance."

In July of 1970 the State Board of Higher Education (the name was later changed to the State Board of Regents) began deliberation on a policy to deal with the capital facilities needs of higher education in Utah. In October of 1971 they adopted an interim policy "in the interest of clarifying the role of the State Board of Higher Education and that of the Institutional Councils" (later renamed Boards of Trustees). This interim policy dealt with the approval processes for proposed capital development projects but did not address the issue of on-going operating support for O&M.

On July 22, 1975 an additional policy document entitled "Capital Facilities Policies and Procedures" was adopted by the Board. This policy established the requirement of Board approval for institutional campus facilities master plans and the role of the Regents in reviewing all institutional requests for funds for capital facilities from state appropriations. It also established Board review of requests for planning and construction of <u>some</u> non- state funded facilities. However, the policies are silent on the issue of O&M funding except for mention of "operating budget constraints" as part of the justification data for consideration of new projects.

The policy required that each project presented for consideration be accompanied by the information contained in the "Planning and Budget Guide" that was included with the policy. The relevant section of this planning guide was the requirement for submission of an estimate of the increase or decrease in annual operating costs that would result by completion of the project. Both the policy and the planning guide were silent on how funding of these costs would be addressed, but it is reasonable to assume that they intended to give them consideration in the deliberations on the annual operating budget request.

This policy continued in force without changes until 1981 when it had become apparent that the existing policy, as it pertained to capital facility projects funded in whole or in part from

sources other than state appropriated dollars (e.g. private gifts, student fees, endowment income, etc.), needed to be reexamined. The extant policy required Regents review and approval of such facilities only if (1) "the proposed construction or remodeling is inconsistent with the role assignment of the institution involved," (2)" the project appears not to be in accord with institutional goals and objectives previously approved by the State Board of Regents," or (3) the project "will require a substantial change in the approved academic or facilities master plan." Otherwise, such projects were the purview of Institutional Councils (forerunners to the Boards of Trustees).

In August of 1981 the advisability of a policy that exempted large projects that may have significant impact on state-appropriated operating budgets from Board review and approval was questioned by several Regents. After subsequent review the policy was amended in February of 1982, effectively bringing these projects under Board jurisdiction for review and approval if the estimated total project costs exceeded \$1,000,000 for the research universities (UU and USU), \$500,000 for four year institutions (WSC and SUSC), and \$250,000 for all other institutions. Even though the discussion that prompted the policy change was based, in part, on the potentially significant impact on state-appropriated operating budgets, no specific addition to policy was adopted to address this issue.

The first amendment to policy pertaining specifically to O&M costs for new facilities was adopted in June of 1988. This amendment adopted language requiring submission of "major" projects to the Regents for approval. It also required that since donated or non-state appropriated facilities require ongoing funds for operations and maintenance, proposals must include arrangements as to how the O&M costs would be covered. It further noted that possible arrangements may include: "(1) separate non-state funding assured through private contracts or an O&M endowment established by a private donor; (2) O&M costs absorbed within existing institutional budgets; or (3) necessary additional funding of O&M costs requested through legislative appropriations." It also stated that "approval of such proposals, when legally required by the State Building Board and the Legislature, will follow their respective established procedures."

While formally recognizing the need to deal with the O&M issue, language explaining the conditions these projects needed to meet in order to qualify for state funded O&M support was not adopted. The policy was not addressed again until October of 1990 when a request was made to explore the feasibility and/or practice of establishing separate endowments to fund the O&M of privately funded buildings. A study was undertaken and the results were reported in the December of 1990 Board meeting. In summary, the study found that there were limited instances of such endowments and that where they did exist, it was usually at private colleges and universities, and that where they did exist they rarely covered more than 50 percent of the

total O&M costs. The conclusion of the study was that while institutions should continue to seek O&M funds from potential donors, it was not realistic to make such funding an absolute requirement. The existing policy was reaffirmed without change.

As a result of concern expressed by some Regents that the policy relating to O&M for non-state funded buildings was "imprecise," in December of 1998 the Regents again amended the policy to add a specific section dealing with these costs. Sections of the general policy were deleted, most notably those "possible arrangements" of private contracts or O&M endowments, as well as absorbing costs within existing budgets. In their place, specific conditions required for state funding of O&M costs were implemented, primarily for those facilities to be used for "approved academic and training purposes and associated support." Other non-state funded projects could be eligible for state appropriated O&M funding on a case by case basis to the extent that they "*relate* to important institutional activities such as instruction, research generating student credits, and service within the institution's role statement" (e.g., museums, theaters, community outreach, and certain research facilities administered by academic units that generate academic student credits or the equivalent thereto, etc.).

The amended policy also described projects that generally would not qualify for state appropriated O&M funding, including space dedicated to athletics events and self-support auxiliary space (i.e., college bookstores, food service, student housing, etc.). In those cases where the requested projects do not qualify for state-appropriated O&M support, the amended policy requires institutions to disclose arrangements as to how O&M costs will be covered, whether by private contracts, O&M endowments, or other generated revenue (e.g., clinical revenue, sales income, etc.).

The policy, as it pertains to state-appropriated support for facilities built in whole or in part from private gifts and other non-state sources, has remained in effect and unchanged since that time.

It is noteworthy that Representative Gerry Adair, Co-chair of the Legislative Capital Facilities Subcommittee, was present at the meeting when these last amendments were approved. The minutes show that he indicated that the Legislature did not want to do anything to chase donors away. He is quoted as saying, "I believe strongly in what you are doing and I want to help you."

APPENDIX F O&M Funding History Spreadsheet

The attached spreadsheet was developed to compare, on a year-by-year basis, existing USHE institutional Operation and Maintenance (O&M) state-appropriated fund budgets with the funding provided by the State Legislature for that purpose.

Starting with the base year of 1987-88, the analysis shows the amounts specifically funded by the Legislature as budget increases in the ensuing years, including utilities increases, increases for new space added, and proportional amounts funded for compensation increases. The impact on O&M budgets of budget reductions made by the Legislature is also reflected. Actual O&M costs for each of the years are also shown. Please note that the Fuel and Power amounts shown as base budget increases in 2004-05 were appropriated as supplemental appropriations for that year by the 2005 legislature and continued as base budget increases in 2005-06. To avoid duplicating the amounts in the ongoing base budget they are shown in 2004-05 as if they had been base budget increases and, therefore, they are **not** shown as increases in 2005-06.

The analysis shows that system wide, for FY 2012 the institutions had budgeted \$22.7 million more than the calculated base budget provided by the legislature and that actual expenditures exceeded the calculated base by \$21.9 million.

APPENDIX H Other Funding for Utility Production and Distribution Infrastructure

CAPITAL DEVELOPMENT FUNDING

The capital development funding for utility infrastructure projects listed below was either specifically part of a capital development budget funded by the Legislature or entailed use of funding designated for a stand-alone system (e.g., heating or cooling system) in a state-funded project that was instead connected to a central system.

- University of Utah In FY 2008 \$4,979,761 of the cost of the East Campus Chiller Plant Expansion project was financed from Capital Development funding provided for the Nursing Building renovation.
- University of Utah Also in FY 2008 \$2,427,217 of the cost of the North Campus Chilled Water Plant and Distribution System project was financed with funding for the USTAR project.
- University of Utah In FY 2009 \$322,500 of the cost of the New Chiller Plant (in the basement of the HTW Plant) and Chilled Water Distribution Lines project was financed with Capital Development funding for the Business Building replacement.
- University of Utah For several years the University of Utah has been faced with increasingly serious HVAC and electrical utility infrastructure issues that have resulted in extensive power outages and steam line ruptures. \$28.5 million was used over several years to repair system failures and to begin to address the remaining problems. The following are the sources of the funds used to date:
 - HTW System A total of \$15.7 million of capital improvement funds was used for the HTW system between FY07 and FY11, including a 2010 legislative reallocation of \$3,550,000 of FY10 capital improvement funds originally dedicated to other needs. In addition, in FY2010, the University financed \$5 million to address failed piping needed to support USTAR facilities.
 - Electrical System \$7.775 million of capital improvement funds were used during FY2009, FY2010, and 2011 to address the most critical aspects of this system.

The University requested \$99 million of Capital Development funding from the 2010 Legislature to address the remaining serious problems. That funding was not provided, but the Legislature did authorize reallocation of the \$3,550,000 of Capital Improvement funds that were used for the HTW system as noted above. The \$99 million Capital Development request was submitted again to the 2011 Legislature without being funded. The request was reduced to \$50 million for the 2012 Legislative request with the understanding that an alternative funding

mechanism would be explored for the remaining balance needed. The 2012 Legislature funded \$22 million of that request. An additional \$13 million was authorized for that purpose from the Capital Improvement funding pool provided by the Legislature making a total of \$35 million available for FY 2013.

- Utah State University \$38.9 million was provided (\$9.2 million in FY 2001 and \$29.7 million in FY 2002) for funding of a new Heat Plant and utilities distribution system (utility tunnels to house steam lines and other adjacent utilities). The new natural gas fired heat plant replaced the old coal fired plant, thereby significantly reducing air pollution, and the utility tunnels resulted in extended life of utility distribution systems and enabled maintenance to be performed without disrupting facilities above the surface.
- Weber State University For FY 2008 the legislature approved \$22.95 million for a new classroom building at the Ogden campus. Approximately \$4.5 million of those funds were used to construct a new central chilled water plant to increase the cooling capacity for the campus.
- Weber State University For FY 2011, the legislature approved \$39.9 million (including \$8.4 million of non-state funds) for construction of a new professional programs building at the Davis campus. Approximately \$3.5 million of those funds were used to construct a new central chilled water plant and extend the underground utility tunnel system.
- Snow College In FY 1997 \$500,000 of the capital funding for the Greenwood Student Center was used to build a steam and condensate tunnel from the north side of the center to the Bell Tower junction on the southwest side.
- Snow College In FY 2009 \$656,525 of the capital funding for the Karen Huntsman Library was used to extend the steam and condensate main tunnel in order to connect with the new building and to install direct bury steam and condensate lines to connect with Center Street.
- Utah Valley University In FY 2001, \$7 million of the capital funding for the state-funded Classroom Building project was earmarked for the addition of a new central plant, boilers, chillers and piping to expand the existing utility infrastructure systems.
- Utah Valley University In FY 2009, \$120,000 of the new Track facility project funding was used to construct a storm water retention basin.
- Utah Valley University In FY 2011, \$1,225,000 of the funding for the Science/Health Sciences Building project was used for addition of a new chiller, expansion of a cooling tower in the Central Plant, and replacement of old boilers with new condensing boilers.

ESCO AND OTHER ENERGY SAVING PROJECT FUNDING

- University of Utah
 - o 1997-2003 New East HTW and Chilled Water Plant (\$22.9 million)
 - o 2006-08 HTW/Co-generation Plant (\$15.8 million)
 - 2008-11 North Campus Chilled Water Plant and Distribution to Buildings (\$7 million)
- Utah State University
 - o 2003 Cogeneration and Chilled Water Plant (\$13.9 million)
 - 2012-13 Chilled Water Thermal Storage Tank (\$2.6 million)
- Weber State University
 - o 2009 Steam System Repairs and Upgrades Phase I (\$1.2 million)
- Dixie State College
 - o 2011-12 Step Down Transformers (\$.5 million)
 - o 2011-12 HTW and Chilled Water System Projects (\$1.3 million)
- Utah Valley University
 - o 2004-05 High Voltage Power Substation (\$2.3 million)
 - o 2004-05 High Voltage Loops, Transformers and Switchgear (\$2.3 million)
 - o 2004-05 Upgrading Central Lighting System Controls (\$2 million)
 - o 2011 Upgrade Central Plant Motors and Pumps (\$74,000)
 - o 2011 Upgrade Substation Transformers and Fans (\$675,000)
- Salt Lake Community College
 - 2012-13 High Voltage Power Substation (\$3.8 million)

OTHER INSTITUTIONAL FUNDS

- University of Utah
 - o 1997-2001 Sewer Projects (\$371,540)
 - o 2004-12 Culinary and Secondary Water System Projects (\$437,580)
 - o 2007-12 HTW Distribution Lines (\$773,718)
 - o 2008-11 No. Campus Chilled Water Plant & Distribution (\$11.1 million)
 - o 2008-12 Chilled Water Plant and Distribution (2.3 million)
 - o 2009-11 Utility Tunnels & Utility Lines: USTAR (\$17.9 million)
 - o 2010-12 Electrical Distribution System Upgrades (\$573,404)
 - o 2010-13 Solar Power for PV Systems (\$2.5 million)
- Weber State University

- 2001-02 Chiller Installation and Piping (\$100,000)
- 2006 Transformer Replacement (\$110,000)
- Southern Utah University
 - o 2008-12 A number of HVAC, Electrical, and other projects (\$512,284)
- Snow College
 - 2000-2011 A number of steam and condensate lines were replaced/installed (\$154,445).
- Utah Valley University
 - o 2002 Compressed Air System Replacement (\$225,000)
 - o 2009 Main Water Line Replacement (\$45,000)
 - o 2010-12 Geothermal Well Rebuild (\$90,000)
- Salt Lake Community College
 - o 2003-2008 Electrical Service Upgrades (\$88,700)
 - 2006 Hot Water Piping Upgrade (\$540,000)

Definition – The type of infrastructure inventoried and assessed includes utility equipment and distribution assets that will result in a capital expenditure or capital request to accomplish periodic replacement, overhaul, or reconditioning. The inventory includes those items that are currently in place as well as items for which installation is currently funded and/or will be underway by July 1, 2012. Other than utility plant buildings housing utility production and distribution assets, the inventory does not include items within campus buildings. An exception for items housed in other campus buildings is made for significant utility infrastructure within a non-utility plant structure that is supporting a larger utility system or group of buildings. Utility infrastructure that is/was acquired using lease/purchase financing should be included in the inventory. Items that are owned and/or leased to the institution by others, such as utility companies, municipalities or others are not included. Likewise, items that are routinely repaired or replaced with operation and maintenance budgets are not considered capital expenditures and are not included in the inventory.

PLANT PRODUCTION ASSETS

Electrical Generation Devices

Cogeneration Hydro Solar Major Emergency Generators (utility plant backup or shared use) Backup Fuel Storage Systems

Heating Production Devices

Steam Production Heat Recovery Generators Standard Boilers Condensers Economizers Backup Fuel Storage Systems Heating Hot Water Heat Exchangers De-aerators Large Primary Distribution Pumps Variable Frequency Drives Large Primary Valves Expansion Tank Systems Geothermal Systems (Wells, Pumps, Heat Exchangers, Heat Pumps, Reversible Chillers)

Chilled Water Production

Chillers of all types Evaporative Cooling Towers De-aerators Large Primary Distribution Pumps Variable Frequency Drives Large Primary Valves Expansion Tank Systems Chilled Water Storage Tanks

Water Conditioning Equipment (Central Plant Boilers, Chilled Water, Heating Hot Water)

Polishers Softeners De-alkalizers

Central Control Systems

SCADA Systems Servers and major control system technologies Utility Meters (electrical and hydronic)

Potable (culinary) Water Production Systems

Water Production Wells Elevated or Ground Water Storage Tanks Chlorinators and Polishers Major Distribution Pumps Pressure Reducing Stations Variable Frequency Drives Major Primary Valves

Irrigation Production Systems

Production Wells Pump Houses and Contents Storage Tanks and Reservoirs Centralized Treatment Devices Filtration Systems

Centralized Compressed Air

Compressors Dryers After Coolers Inner Coolers

DISTRIBUTION ASSETS

<u>Electrical</u>

Substations: Transformers Capacitors Major Switches and Switchgear Voltage Regulators Protective Devices (Re-closure switches, etc.)

Distribution:

Wire feeders (underground or overhead) Duct Banks and Vaults Major Switchgear Underground Electrical Switching Manholes Protective Devices (Re-closure switches, etc.) Meters

Heating Distribution Systems

Steam and Heating Hot Water Distribution (System includes supply and return pipes, pipe insulation and valve jackets, containment systems (Perma-pipe and RickWil) expansion loops, condensate return pipe, traps, valves, pumps, controls, gauges, meters etc.)

Chilled Water Distribution (System includes supply and return pipes, valves, controls, gauges, meters, etc.)

Tunnel Systems (concrete, masonry and other walkthrough, shallow tunnel)

Natural Gas Distribution Infrastructure

Pipes, valves, metering devices, controls gauges, etc.

Potable Water Systems (pipes, valves, chlorinators, controls, tracers, etc.)

Irrigation Piping Systems (pressurized mains, controllers, valves, pressure reducing stations, pumps, VFDs, strainers, sprinklers, etc.)

Sanitary Waste Water (pipes, manholes, lift stations, grinder pumps, pretreatment systems, etc.)

Storm Water (pipes, inlet structures, retention and detention basins, infiltration wells, diversion structures, hardened channels)

Compressed Air Distribution from a Central Plant (piping, valves, regulators, dryers, etc.)

APPENDIX J Information Technology Infrastructure

Information Technology (IT) has a rapidly and continuously developing infrastructure that has quickly transitioned over time from mainframe applications to PCs, and now toward cloud networking environments. There also have been tremendous advances in wireless technologies in recent years. New generations of IT equipment are emerging more rapidly than they can often be assimilated. Replacement is not driven by the component being worn out but rather by new generations of equipment with expanded capabilities that make the old equipment obsolete. Accordingly, it is very difficult to predict future IT needs or the economic service lives of current computer technologies and internet assets since most IT assets become obsolete long before they actually fail or require replacement due to age.

In contrast, the utility infrastructure applications found in this report are managed by the institutions' Facility Management (FM) organizations, and these components typically have predictable life cycles that are usually 20 years or more. The expected life of a transformer, conductor, air handler, boiler, chiller, pump or switch is very predictable. For example, with proper maintenance, boilers can last for over 50 years, transformers can last over 20 years, and chillers can last 20 years or more. FM supported infrastructure is usually replaced because of failure after a long service life, and can most often be expanded to add more capacity without discarding the equipment that is already in use. This long service life of FM supported utilities and the ability to expand capability or capacity without wholesale replacement distinguish these systems and make their management entirely different from those IT managed systems within the institution. It is, therefore, recommended that if it is determined to be desirable to inventory and evaluate IT infrastructure in USHE institutions, it should be done by a separate working group that specializes in IT infrastructure assets.

APPENDIX K Construction Cost Control Corp. Replacement Costing of USHE Utilities Infrastructure

The document that follows is the complete report of the study done by Construction Control Corporation for the purpose of estimating the cost, by time period, of future funding needs to renew and replace the utilities infrastructure production and distribution assets on USHE campuses. The study is based on comprehensive inventories of these assets that were compiled by facilities professionals at each of the USHE campuses and includes the relevant information about the types of assets, sizes, and installation dates.

Please note that the projected costs are based on *current pricing factors with no inclusion of future inflation*.

UTAH HIGHER EDUCATION UTILITIES

Due to ongoing problems with age and deterioration of the utility infrastructures on the various Utah higher education campuses, The Utah System of Higher Education (USHE) commissioned a study of an ongoing replacement program for these systems.

The facilities departments at the various USHE institutions were tasked with inventorying their utility infrastructures and establishing sizes and ages of installations for their campus utilities. This inventory was substantially completed in September, 2012.

In October, 2012 Construction Control Corporation of Salt Lake City was hired to establish costs for the proposed replacement of these systems. After a series of meetings with Ralph Hardy of the USHE and various representatives of the universities, a plan was developed for this cost analysis. The study would be priced for replacement of services over the next fifty years. These costs would be established as follows:

0-5 years (immediate needs) 5 years 10 years 20 years 30 years 40 years 50 years Beyond 50 years

Utah colleges and universities included in this study are: University of Utah (main campus) – Salt Lake City Utah Valley University – Orem Utah State University (main campus) – Logan Utah State University (CEU) - Price Weber State University (main campus) – Ogden Southern Utah University – Cedar City Snow College – Ephraim Dixie State College – St. George Salt Lake Community College – Redwood Taylorsville Campus, South Salt Lake Campus, Jordan Campus, Miller Campus, Meadowbrook Campus

Costs are based on Salt Lake City construction costs as established by Construction Control Corporation's data base. Unit costs are adjusted 5% for remote location factors for Southern Utah University and Dixie State College, and 10% for Utah State University (CEU) and Snow College.

Unit prices also include markups for the following:

Normal subcontractor construction cost Plus 10% Design and administration fee Plus 10% General contractor overhead and profit Plus 10% Contingency

All costs are based on current dollars. No inflation is included in this study.

All campuses were visited by representatives of Construction Control Corporation. Facility representatives were interviewed. Facility utility systems were physically viewed and discussed.

The inventories established by the university facilities groups were entered into a master Excel spreadsheet.

Life expectancies for the various systems were established as follows:

Utility tunnels	50-75 years
Boilers & heating plant equipment	30-50 years
Steam lines	25-50 years
Condensate lines	25 years
Pump lines	15-30 years
Electrical switch gear	40 years
Electrical substation & distribution	40 years
Storm water systems	50-60 years
Smaller boilers & pumps	30 years
Chillers – large	20-25 years
Chillers – smaller	20 years
Controls systems	20 years
Chilled water systems	50 years
Sanitary sewer systems	60 years
Culinary water systems	50-60 years
Gas lines	50 years
Solar electrical systems	15 years

The unit pricing was established as discussed above and the spreadsheets were completed. The spreadsheets were then sent to the USHE, who reviewed the spreadsheets and sent them to the various universities for their review. Following this review, minor changes were made and Construction Control Corporation's report was incorporated into the final report submitted to the Utah Legislature by the USHE.

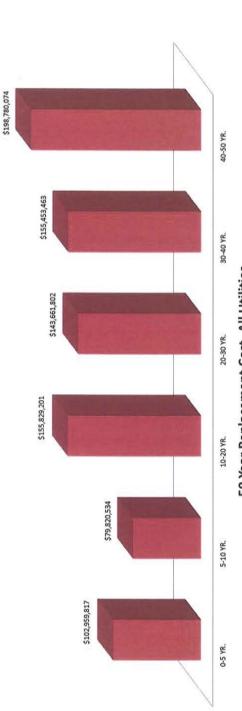

Signed:

Kenneth W. Ament President

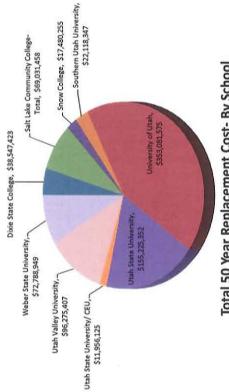

Kris A. Larson, CPE Senior Estimator
